Linking Halal Food Certification and Business Performance

Purpose: The purpose of this empirical research is to explore the relationship between Halal food certification and business performance. This study argues that Halal food certificate implementation positively influences business performance.

Design/methodology/approach: A total of 210 Halal certified food manufacturing companies in Malaysia participated in the study. Data were gathered through a structured questionnaire and were analysed using partial least squares structural equation modelling technique.

Findings: The study proved that Halal food certification has a positive relationship with operational performance. Additionally, operational performance mediates the relationship between Halal food certification and financial performance. Altogether, this signifies that Halal food certificate implementation positively influences business performance.

Practical implications: By linking Halal food certification and business performance, managers may be aware of the significant role of Halal food certification in influencing operational and financial performance. It would entice more food companies to become Halal certified that opens up an opportunity to a lucrative Halal food industry. It also empirically justifies that a religion-based food certification has the ability to influence business performance, consistent with other established food standards such as ISO 22000 or HACCP.

Originality/value: Although numerous studies have concentrated on well-established food certifications, the expanding Muslim population, rising demand for Halal food, and lucrative Halal food market have raised the attention on Halal food certification research among academicians and practitioners. This research is able to highlight the importance of implementing Halal food certification among food companies as it could potentially lead to superior business outcomes.

Article Classification: Research Paper

1. Introduction

In recent years, there has been an increasing interest in Halal food certification, particularly from the consumers' perspectives. Research on Halal food certification often focused on consumer purchase intentions or behaviours (Aziz and Chok, 2013), willingness-to-pay (Verbeke *et al.*, 2013), awareness or perceptions (Haque *et al.*, 2015), and confidence level (Mohamed *et al.*, 2013). The reasons behind the rising attention on Halal food certification research could be attributed to the heightened awareness, concern, and knowledge on Halal food among consumers.

Despite the growing interests, the scope of Halal food certification research is rather imbalance and the disparity is shown by the limited literature on Halal food production research (Talib *et al.*, 2016a). Research that studied the upstream parties of the Halal food chain (i.e suppliers, manufacturers, producers, retailers) remained scarce. These lack of Halal food production research, however, commonly studied the attributes, reasons, readiness, and perceptions on Halal food certification (Rafiki and Wahab, 2016; Rahman *et al.*, 2016; Talib *et al.*, 2015; Badrudin *et al.*, 2012; Marzuki *et al.*, 2012). Scholars have yet to probe a more significant investigation on Halal food certification, in particular, its association with improved business performance.

Undoubtedly, food companies have begun to implement Halal food certification on a global scale (Lever and Miele, 2012). International food companies such as McDonald's and Nestle have extensively implemented and introduced Halal certification into their operations and productions (Fischer, 2016 and 2012). According to Talib *et al.* (2015), this phenomenon is caused by the relentless consumer pressure and the profound food industry competition. However, the pursuit of Halal food certification could be futile if firms are unable to enjoy the advantages from being certified. More precisely, the extensive efforts to implement Halal food certification are deemed impractical if it does not contribute to enhanced business performance. Therefore, this raises the question whether Halal food certificate implementation can influence business performance or not?

Considering the uneven scope of Halal food certification research and the limited understandings on Halal food production research, this paper attempts to link previously unconnected variables of Halal food certificate implementation and business performance. Hence, the purpose of this study is to explore the relationship between Halal food certification and business performance. This study aims to obtain data which will help to address the Halal food certification research gaps. Understanding the link between Halal food certificate implementation and business performance will benefit food companies in terms of enhanced knowledge, encourage certified firms to remain verification, and potentially entices non-certified firms to implement Halal food certification.

This paper first gives a review of the relevant literature on Halal food certification and business performance. It will then go on to discuss the development of research framework and proposing several research hypotheses. Subsequently, the paper then presents the methodology used in this research. Accordingly, the results are analysed and the findings are then discussed and interpreted. Lastly, the paper concludes by highlighting the summary, limitations, and several recommendations for future studies.

2. Literature Review

Halal food certification, either in the form of license, logo, seal, or stamp, is a form of identification to inform users that a food product is sourced, produced, and distributed in accordance with the strict Islamic standards. Throughout this paper, the term Halal food certification refers to Riaz and Chaudry's (2004, p. 170) definition that it is "a document issued by an Islamic organisation certifying that the products listed on it meet Islamic dietary guidelines, as defined by [a specific] certifying agency".

The connection between Halal food certification and food safety and quality is expected because food manufacturers must undergo a series of stringent and exhaustive orientations, inspections, and corrective measures before certification is granted. Past research demonstrated that Halal food certification is a type of food safety certification, consistent with established standards, for instance, the HACCP, GMP, or ISO 22000 (Demirci et al., 2016; Talib et al., 2015; Nawi and Nasir, 2014; Kohilavani et al., 2013).

There is a large number of published studies (Chen et al., 2015; Escanciano and Santos-Vijande, 2014; Kafetzopoulos and Gotzamani, 2014; Macheka et al., 2013; Karaman et al., 2012; Mensah and Julien, 2011) that connect food safety certification with improved business performance. For instance, Chen et al. (2015) explained that food companies in New Zealand experienced improved market performance and better relationship with customers. Meanwhile, Escanciano and Santos-Vijande (2014) revealed that ISO 22000-certified companies in Spain experienced both internal and external benefits.

The past studies reviewed thus far provide evidence that food certification, in general, has the ability to improve business performance. However, past research on Halal food certification have sporadically and disjointedly specified the benefits of implementing Halal food certification. Scholars have yet to comprehensively link Halal food certification and business performance. Table 1 elucidates the terse and disperse association between Halal food certification and business performance.

As shown in Table 1, it is clear that scholars have the understanding and confidence that, in principle, Halal food certification could potentially influence business performance. Yet, studies that justify the link remains untested while empirical evidence is lacking. Nevertheless, it gives the opportunity for this study to comprehensively study the said relationship and reinforce the notion.

3. Research Framework and Hypotheses

One of the established theory for assessing business performance is the Resource-based View (RBV) theory. In a seminal work linking firm resources and sustained competitive advantage, Barney (1991) explained that any form of resources made available to a firm, if used effectively and efficiently, could lead to favourable business outcomes. The foundation of the RBV theory is based on the assumption that a firm's tangible or intangible attributes, if correctly executed, could possibly create inimitable, rare, non-substitutable, and valuable possessions. The ability to have resources of such natures may eventually benefit a firm with sustained competitive advantage.

Based on Barney's (1991) concept of RBV, this paper argues that certification is essentially a type of resources, deployed by food companies as a tool to achieve sustainable competitive advantage. We argue that food companies are aggressively producing and selling homogeneous products, whilst competing in an extremely competitive, highly volatile, and saturated market. Thus, food companies are exploring ways to stand out from the competition and strive to become the market leader by offering unique products to the consumers. Therefore, food companies are emphasising on securing Halal certification, which signals and enable them in offering better products to the consumers.

To support the argument, evidence from past research indicated that firms utilised various types of certification as an instrument to achieve desired business outcomes (Talib *et al.*, 2016b; Fikru, 2014; Kafetzopoulos and Gotzamani, 2014; Sampaio *et al.*, 2009; Chow-Chua *et al.*, 2003; Sum *et al.*, 2001). Likewise, Talib *et al.* (2016b, p. 470) explained that “apart from implementing Halal certification as a tool to gain business legitimacy, industry practitioners use Halal certification as a mechanism to improve organisational performance”. Hence, this paper postulates the following hypotheses:

H1: There is a positive relationship between Halal food certification and operational performance.

H2: There is a positive relationship between operational performance and financial performance.

In addition, business performance is generally observed as the integration between two notable performance measures, specifically the operational and financial performances (Feng *et al.*, 2008). In the context of certification research, scholars concurred that certification can influence both operational and financial performance. However, for the purpose of this study, we assume the study done by Psomas *et al.* (2013) that operational performance mediates the relationship between Halal food certification and business performance. This research maintains that, logically, implementing Halal certification per se would not instantaneously influence financial performance as it requires the proper and comprehensive operational executions. The success obtained from well-enforced operations would then potentially influence financial performance. Therefore, this paper postulates that:

H3: Operational performance mediates the relationship between Halal food certification and financial performance.

The framework of this research is depicted in Figure 1. Therefore, drawing from the review of relevant literature and applying the RBV theory as the basis for a theoretical framework, this paper posits that Halal food certificate implementation positively influences business performance.

Figure 1: Proposed Theoretical Framework

4. Research Methodology

As the study aims to assess the link between Halal food certification (MS1500) and business performance, it applies a quantitative research design and employs a survey methodology. Data were collected using a self-administered questionnaire. The questionnaire was designed based on the review of past literature and sourced from several published instruments that were akin to the present study.

The questionnaire was divided into three parts (Part A, B, and C). Part A contains 25 items relating to the components of Halal food certification, while Part B consists of 12 items on operational (eight items) and financial performances (four items). Part C involves five items designed to gather the respondents' demographic information. For Part A and B, a five-point Likert scale was used, ranging from 1 (strongly Disagree) to 5 (strongly agree). In Part C, nominal scales were used to solicit information on personal and organisation backgrounds. Prior to data collection, the questionnaire was pre-tested to check the wording, sequencing, clarity, relevance, adequacy, and the overall structure.

The population for this study consisted of the MS1500-certified food manufacturing companies in Malaysia. The MS1500 certification and the Malaysian Halal food industry were chosen on the basis that the country is the pioneer and leader in the Halal food industry and its certification is highly recognised (Rahman *et al.*, 2013). The sampling population was derived from the Federation of Malaysian Manufacturers' directory on Halal food. A purposive judgemental sampling technique was applied and managerial personnel overseeing the MS1500 procedures were identified as the unit of analysis. The selection is based on the understanding that managerial personnel (i.e. business owner, CEO, quality control managers, senior managers) have comprehensive knowledge on operation and production and simultaneously command influential role in an organisation (Zailani *et al.*, 2015).

Once data were gathered, the correlational relationship between Halal food certification and business performance were examined using partial least squares structural equation modelling (PLS-SEM) technique. A PLS-SEM technique was chosen for data analysis because this approach is suitable for an exploratory research where the substantial understanding and information is rather limited (Hair *et al.*, 2011). Moreover, PLS-SEM is a latent variable modelling technique that simultaneously observes multiple variables and recognises measurement errors (Hair *et al.*, 2014a). Besides, scholars in the field of business research have widely applied PLS-SEM as it has a comparatively high statistical power to analyse complex structural equation models with multiple constructs (Hair *et al.*, 2014b, 2012a, 2012b). The SmartPLS 2.0 application (Ringle *et al.*, 2005) was used for data analysis.

5. Results and Analysis

5.1. Demographic Profile

Initially, a total of 500 self-administered questionnaires were distributed among MS1500 Halal certified food manufacturing companies in Malaysia. However, only 210 usable questionnaires were returned and this gave a response rate of 42 percent. Out of the 210 food manufacturing companies participated in this study, a majority of them are fully Malaysian-owned corporations (68.1 percent).

Furthermore, in terms of the size of operation, a large percentage of the respondents had 6 to 75 employees (43.3 percent). This figure indicates that majority of the respondents were small-sized food manufacturing companies. Collectively, 69.5 percent of the respondents were small-medium enterprises (SME). Additionally, more than half of the respondents had been established for 11 years or more (53.3 percent).

Moreover, the majority of the respondents held middle-managerial position (i.e. senior manager or manager) with 71.5 percent, while the remaining 28.5 percent held top managerial position (i.e. owner, CEO, director). Even though 108 respondents (51.4 percent) only had five years or less of experience in the Halal food industry, a considerable portion of the respondents (102 respondents; 48.5 percent) still possess reasonable experience.

5.2. Measurement Model Evaluation

To evaluate the PLS-SEM measurement model, four types of systematic assessments were conducted. It should be highlighted that in this paper, a reflective measurement model was applied instead of a formative measurement model. Following Hair *et al.* (2014a) assessments on reflectively measured construct, the four reliability and validity analyses were a) internal consistency (composite reliability), b) indicator reliability, c) convergent validity (average variance extracted, AVE), and d) discriminant validity. For this study, there were five exogenous constructs, namely human resource (HUM), infrastructure and equipment (INF), production process (PRO), marketing function (MAR), and logistics and distribution (LOG), and two endogenous constructs, specifically operational performance (OPER) and financial performance (FPER).

Firstly, the internal consistency reliability was evaluated by assessing the composite reliability (CR). CR was chosen because the traditional use of Cronbach's alpha (CA) has the tendency to underestimate the internal consistency reliability (Hair *et al.*, 2014a). To assess CR, Hair *et al.* (2014a, 2011) suggested a value of 0.70 and above to indicate internal consistency. As shown in Table 2, the CR values of this study were above the 0.70 threshold ranging between 0.899 (MAR) and 0.943 (OPER). It is necessary to specify that a CR value of more than 0.95 could potentially indicate a common method bias (Straub *et al.*, 2004).

Table 2: Internal Consistency and Indicator Reliability

Construct	Indicator	Loading	CR	CA
HUM	HUM1	0.893	0.940	0.920
	HUM2	0.855		
	HUM3	0.897		
	HUM4	0.863		
	HUM5	0.840		
INF	INF1	0.772	0.900	0.860
	INF2	0.719		
	INF3	0.867		
	INF4	0.846		
	INF5	0.792		
PRO	PRO1	0.806	0.923	0.900
	PRO2	0.873		
	PRO3	0.905		
	PRO4	0.861		
	PRO5	0.783		

Table 2: Internal Consistency and Indicator Reliability (continued)

Construct	Indicator	Loading	CR	CA
MAR	MAR1	0.797	0.899	0.862
	MAR2	0.759		
	MAR3	0.842		
	MAR4	0.793		
	MAR5	0.810		
LOG	LOG1	0.821	0.922	0.893
	LOG2	0.893		
	LOG3	0.847		
	LOG4	0.896		
	LOG5	0.727		
OPER	OPER1	0.816	0.943	0.932
	OPER2	0.818		
	OPER3	0.813		
	OPER4	0.804		
	OPER5	0.820		
	OPER6	0.852		
	OPER7	0.823		
	OPER8	0.838		
FPER	FPER1	0.798	0.936	0.909
	FPER2	0.881		
	FPER3	0.924		
	FPER4	0.938		

Note: CR (Composite Reliability); CA (Cronbach's Alpha); AVE (Average Variance Extracted)

Secondly, indicator reliability was analysed to measure the outer loading variances that explained the underlying construct (Hair *et al.*, 2014a). In order to demonstrate substantial reliability, the outer loading of greater than 0.70 is recommended (Hair *et al.*, 2014a, 2011). The indicator loadings for all exogenous and endogenous constructs in this study (Table 2) indicated that each construct sufficiently captures a common concept. Thus, no indicator was removed and the measurement model was suitable for further analysis.

Thirdly, to evaluate the convergent validity, this paper refers to the value of average variance extracted (AVE). An AVE is “the grand mean value of the squared loadings of the indicators associated with the construct” (Hair *et al.*, 2014a), which represent the collectiveness of a particular construct. To achieve a significant convergent validity, Hair *et al.* (2011) recommended an AVE value of more than 0.50. The AVE values for each construct in this study are presented in Table 3, which reveal the value of above 0.50. Hence, these AVE values signify that more than half of the construct variances were explained by their respective indicators.

Table 3: Convergent and Discriminant Validity

	AVE	FPER	HUM	INF	LOG	MAR	OPER	PRO
FPER	0.786	<i>0.886</i>						
HUM	0.757	0.402	<i>0.870</i>					
INF	0.641	0.298	0.670	<i>0.800</i>				
LOG	0.704	0.487	0.603	0.662	<i>0.840</i>			
MAR	0.641	0.354	0.486	0.569	0.592	<i>0.800</i>		
OPER	0.677	0.677	0.568	0.624	0.661	0.572	<i>0.822</i>	
PRO	0.717	0.349	0.646	0.765	0.610	0.516	0.574	<i>0.848</i>

Lastly, discriminant validity was measured to decisively distinguish a construct from one another in a path model (Hair *et al.*, 2014a). This paper evaluates discriminant validity by assessing the Fornell and Larcker (1981) criterion, as suggested by Hair *et al.* (2011). The result for discriminant validity is tabulated in Table 3. As shown in Table 3, the square root of each construct's AVE (*in italic*) are greater than its individual correlation with any other construct. This proves that every construct in this study are truly unique and individually measured. Therefore, based on the reliability and validity evaluations of the measurement model, this paper proves that the questionnaire deployed for this study satisfied every empirical measurement.

5.3. Hierarchical Component Model

Before proceeding to examine the structural model, it is important to note that a Hierarchical Component Model (HCM) procedure was performed. HCM was performed as the model could be operationalised at a greater level of generalisation (Hair *et al.*, 2014a). HCM is often used in PLS-SEM as an approach to summarise multiple lower-order constructs (LOC) into a single multidimensional higher-order construct (HOC) (Becker *et al.*, 2012; Ringle *et al.* 2012). In this study, the Reflective-Formative (Type II) HCM was used. To perform HCM for PLS-SEM, the paper observed the two-stage approach suggested by Hair *et al.* (2014a), Becker *et al.* (2012), and Ringle *et al.* (2012).

In the first-stage approach, the LOCs of HUM, INF, PRO, MAR, and LOG were combined together to create a HOC, identified as Halal Food Certification (HFC). Then, a repeated indicator approach was performed (Hair *et al.*, 2014a; Becker *et al.*, 2012). This approach assigned the LOCs reflective indicators to the HFC construct. This means that the HFC has 25 similar reflective indicators as the LOCs. Subsequently, in the second-stage approach, the LOCs latent variable scores were assigned as the manifest variable for the HFC construct. In this stage, the LOCs are now the indicators for HFC.

Once the HCM was performed, the PLS path model is more parsimonious and identical to the proposed theoretical model (Figure 1). The next step was to evaluate the HCM. According to Hair *et al.* (2014a, p. 231), “the same measurement model evaluation criteria apply to the HOC as for any other construct in the PLS path model”. Correspondingly, the results for the newly developed HCM is presented in Table 4. The assessment criteria shown in Table 4 indicate that the HCM satisfies every measurement model reliability and validity evaluations, and therefore, it is appropriate for structural model evaluation.

Table 4: Reliability and Validity of HOC

Construct	Reliability		Validity			
	CR	CA	AVE	FPER	HFC	OPER
FPER	0.936	0.909	0.786	0.886		
HFC*	0.918	0.887	0.691	0.457	0.831	
OPER	0.944	0.932	0.677	0.680	0.721	0.822

Note: *HFC construct is a HOC (where HUM, INF, PRO, MAR, and LOG constructs are the LOCs)

5.4. Structural Model Evaluation

Having sufficiently evaluated the measurement model, this part of the paper now analyses the structural model. Structural model evaluation involves two important assessments, specifically the coefficient of determination (R^2) and predictive relevance analyses (Q^2) (Hair *et al.*, 2011). The coefficient of determination measures the predictive accuracy of the exogenous constructs combined effects on the endogenous constructs. As a rule of thumb, Hair *et al.* (2014a and 2011) indicated that R^2 value of 0.25, 0.50, and 0.75 signify a weak, moderate, and substantial predictive accuracy. For this study, the R^2 value for OPER is 0.520 while FPER is 0.463. The findings imply that the HFC construct moderately predicts 52 percent of the variance of OPER construct. Likewise, the OPER construct moderately explains 46.3 percent of the variance in FPER the construct.

To measure the predictive relevance, the Q^2 value was obtained using the blindfolding technique (Hair *et al.*, 2014a). A blindfolding technique was performed to obtain cross-validated redundancy measures for each endogenous constructs. A Q^2 value of larger than zero for an endogenous construct is desirable. As a measure of predictive relevance, the values of 0.35, 0.15, and 0.02 indicate that an exogenous construct has a large, medium, and small predictive relevance on an endogenous construct (Hair *et al.*, 2011). In this study, the Q^2 for FPER was 0.352 while OPER was 0.353. Therefore, the resulting Q^2 values of more than zero signify that the HFC exogenous construct has a large predictive relevance for the OPER and FPER endogenous constructs.

5.5. Hypotheses Testing

In order to test the three proposed hypotheses, the significant relationships of each path coefficients are assessed. A bootstrapping technique with 5000 resampling and a two-tailed test was performed. The results for hypothesis H₁ and H₂ are shown in Table 5. In Table 5, the results revealed that Halal food certification had a positive, strong (path coefficient = 0.721) and significant (t-statistics = 19.824) relationship with operational performance, thus H₁ is supported. Furthermore, the results shown in Table 5 also indicate that the relationship between operational performance and financial performance was positively significant (t-statistics = 14.863), and therefore, H₂ is supported.

Table 5: Hypotheses Testing

Hypothesis	Path	Path Coefficient	Standard Error	p-value	t-value	Decision
H ₁	HFC → OPER	0.721	0.036	0.000*	19.824	Support
H ₂	OPER → FPER	0.680	0.046	0.000*	14.863	Support

Note: *t-statistics for two-tailed test: > 2.57 (p < 0.01)

To test for mediation, this paper refers to Hair's *et al.* (2014a) procedures. Specifically, the indirect relationship via OPER mediator effects the direct relationship from HFC to FPER in the mediator model. Additionally, the variance accounted for (VAF) was used to determine the size of indirect effect in relation to the total effect (Hair *et al.*, 2014a). The result for the operational performance mediating the relationship between Halal food certification and financial performance is shown in Table 6.

Table 6: Analysis of Mediating Effect

Hypothesis	Path	Direct Effect	Indirect Effect	Total Effect	VAF	Decision
H ₃	HFC → OPER → FPER	0.468*	0.525*	0.993*	0.529 ≈ 53% (Partial Mediation)	Support

Note: OPER is the mediating construct; VAF is equal to indirect effect divided by total effect; * p < 0.01

Based on the results shown in Table 6, given that the direct, indirect and total effects are significant ($p < 0.01$), and that the VAF value indicates 0.529, it gives the interpretation that the OPER construct partially (53 percent) moderates the relationship between HFC and FPER. In other words, operational performance (OPER) moderately absorbs Halal food certification (HFC) variable's effect on financial performance (FPER). Therefore, this supports the H₃ hypothesis that operational performance mediates the relationship between Halal food certification and financial performance.

6. Discussion and Conclusion

The present study was designed to explore the relationship between Halal food certification and business performance. For this research, the business performance variable is the combination of operational and financial performances. Additionally, three hypotheses were proposed and a theoretical framework was developed (Figure 1).

The first hypothesis in this study sought to establish the link between Halal food certification and operational performance. Based on the results of this study, it is proven that Halal food certification has a positive and significant relationship with operational performance. Given that the association between Halal food certification and operational performance was sporadically mentioned and empirical evidence was lacking, the findings from this study offer a new insight that a religion-based certification has similar aspects and relation with operational performance. This further strengthens previous notions that Halal food certification is a type of food safety certification and the safety, quality, hygienic, and control attributes are consistent with the likes of HACCP or ISO 22000 (Demirci *et al.*, 2016; Talib *et al.*, 2015; Nawi and Nasir, 2014; Kohilavani *et al.*, 2013).

Furthermore, the results emerged from this study are consistent with those of Chen *et al.* (2015), Escanciano and Santos-Vijande (2014), Kafetzopoulos and Gotzamani (2014), Macheke *et al.* (2013), Karaman *et al.* (2012), and Mensah and Julien (2011) who demonstrated that the implementation of food certification, in this case the MS1500, positively influence operational performance. Hence, this study further contributes to the growing body of Halal food certification literature and advances the understandings of the benefits from Halal food certificate implementation.

The second hypothesis in this study was intended to establish the positive relationship between operational and financial performance. The empirical evidence from this study revealed that there is a positive and significant relationship between operational and financial performance. The support of the second hypothesis substantiates the findings of Kafetzopoulos and Gotzamani (2014), who suggested that operational performance generates a significant

contribution to financial performance. It can thus be suggested that the implementation of Halal food certification would potentially impact financial performance.

For the third hypothesis, this study postulates that operational performance mediates the relationship between Halal food certification and financial performance. Evidence from this study showed that operational performance was in fact a mediating factor between the Halal food certification and financial performance relationship. Although past studies (Kafetzopoulos and Gotzamani, 2014; Psomas *et al.*, 2013) did not study the mediating role of operational performance, the findings from this study offer a newer and an alternative perspective. This paper argues that in addition to the operational performance of improved Halal food integrity, superior product quality and safety, and greater market shares, Halal food certification may play a central role in improving financial performance. For example, it could be argued that, due to the achievement in greater market shares (operational performance), this could lead to potential financial performance that includes sales growth or larger net profit. Taken together, the overall findings confirm the association of previously unconnected variables between Halal food certification and business performance.

Moving forward, the empirical evidence of this study suggests that business performance can be achieved through Halal food certificate implementation. However, it is important to bear in mind that business performance would not materialise if Halal food certification procedures and executions are merely ‘for show’. Managers should be mindful that Halal food certification for the sake of appearance rather than for operational and financial achievements would not only cause unsustainable business operations but also compromised the integrity of Halal food products.

In terms of theoretical contribution, this study provides a framework for the connection between Halal food certification and business performance. This study further ratifies the suitability and relevance of the RBV concept in certification research (Talib *et al.*, 2016b; Fikru, 2014). Besides, by applying the concept of RBV as the basis of research framework, the findings of this study enhanced the understanding of the Halal food certification integral function towards sustainable business. It is hoped that the empirical evidence from this study would direct managers’ attention on ensuring the efficient implementation of MS1500 as it is capable of affecting food companies’ operations and bottom lines.

The insights gained from this study could entice more food companies to implement Halal food certification, particularly the MS1500. Despite its exploratory nature, this study informs managers that Halal food certification can be utilised as a tool to gain superior business performance. For instance, with Halal food certification, food companies have the potential to improve their productivity and standardising internal operations. Furthermore, improved operational performance would then contributes to sales and profit growth. Evidently, the

prospect of improved business performance could potentially persuade non-certified food companies to become Halal certified. Likewise, the knowledge gained from this study could be useful to foreign food companies and managers who wish to venture into the Malaysian Halal food industry. The ability to obtain authorised and recognised MS1500 would not only facilitate the entry into the Malaysian food industry, it also alleviates the access to the highly lucrative international Halal food industry of more than a billion consumers worldwide.

The generalisability of this study is subjected to certain limitations. As the samples were limited to Malaysian MS1500 certified food manufacturers, and because there are numerous Halal food certifications from various authorities and agencies, the relation with business performance might vary. Hence, future research on other established Halal certification from notable authorities (i.e. Islamic Religions Council of Singapore, HalMQ; Indonesian Council of Ulama, HAS 23000) is encouraged in order to reach more comprehensive understandings on Halal certification relation with business performance. Additionally, the empirical evidence and the supported hypotheses are based on a cross-section of the current environment. Thus, the study does not observe the magnitude of the relationship between Halal food certification and business performance. Therefore, a longitudinal research that scrutinises the proposed relationships over a period of time should be an agenda for future studies. Nevertheless, the present study provides a solid platform for future scholars to work on.
